

THE MINDSET OF A GAMECHANGER

How to Become Your Best Self, Live Audaciously
And Make 2017 Your Best Year Ever!

LETHIA OWENS, CSP

About the Author

Lethia Owens is known for her unparalleled ability to help businesses brand their brilliance, monetize their message and dominate their market resulting in over 6 million in revenue

generated for her clients. Lethia Owens is a best-selling author, Tech CEO, branding expert and market domination strategist who is ranked #8 among the top 30 brand gurus in the world.

Lethia went from high school dropout to highly paid speaker and she has gone from selling other people's trash at flea markets to selling high-end consulting services in the world market.

Lethia knows what it takes to be a game changer. She's a little geeky, magnetically motivating and oozing with brilliant business strategies that challenge you to get in the game because game changers, not spectators win championships. She is the founder of Next Level Branding & Marketing, and her message of reinvention, courage and self-empowerment has inspired audiences on Fox, CBS and NBC affiliate networks.

Introduction: It All Starts With Your Mind

No matter what it is you want to achieve in life – it all starts with your mind. Your mindset is responsible for how successful you are in any given career or business pursuit, how others see you, your health, your physical strength and even how happy you are with what you have accomplished.

Any change you want to create in your life first **starts with the decision to make that change**. This conviction must come from within and it increases the chance that you will accomplish it.

The Mindset of a Game Changer

Take a look at the most successful people in the world. One thing they almost always have in common is an absolutely unwavering commitment and determination to what they want to achieve. Take Arnold Schwarzenegger for instance – reportedly, he was so determined to become a champion bodybuilder that he would even break in to the gym on the days when it was closed in order to train. I myself, was so committed to becoming an excellent professional speaker that I did over 100 free talks my first year in business.

People who are truly committed to what they want to achieve will wake up at 5 am every morning in order to workout, to work on their project or business, to research, to learn or to train. They press forward even when tired and they don't give up.

This same commitment and passion is what helps you to stay focused even when distractions and disappointments try to derail you.

Having a strong conviction and belief that you can and will succeed increases your chance of success. When you are truly driven and when you have complete faith in yourself, you exude passion and confidence – which inspires others and convinces them to take risks on you. This is called the 'law of attraction' and in a nutshell, it

means that for others to believe in you, you first need to believe in yourself!

I believe you already have access to everything you need to be completely happy, successful, fulfilled and to make the most of your opportunities, experiences and relationships.

I'm going to teach you the skills you need to really take control of your thoughts and develop the mindset of a game changer. If you really want to change your life, you must change how you think.

In this book, you will learn:

- How your brain works and how this impacts your life and work
- How you can leverage the power of your brain in order to alter your emotional state and reprogram your thinking
- How to more effectively work with others by understanding how they are wired
- How to increase your confidence and magnetically attract what you want in life
- How to overcome your fears and other obstacles so you can step into your next level of success

The Mindset of a Game Changer

- How to increase your energy levels and keep your mind alert
- How to accomplish incredible focus and tap into 'flow states'
- How to develop an engaging, charismatic and magnetic personality
- And much more...

Chapter 1: Understanding Your Brain – Some Basic Psychology

Who Are You? What makes you, you?

The answer in part rests within your brain which is made up of billions of neurons – small cells that have tendril-like extensions reaching out and into the different corners of your skull. These neurons can be created, destroyed or changed via your experiences and they represent all kinds of things including memories, sights, smells, thoughts and ‘commands’ to move your body.

Let's look at the science and biology behind this for a moment.

When an electrical impulse moves through a neuron, this means it is ‘firing’ and thus you experience whatever correlates with that firing. If a doctor were to open up your skull and use an electrode to stimulate individual neurons, you might see a point of red light, move your arm and another might make you recall a childhood memory.

These neurons are all interconnected and the more often two neurons fire at once, the more connected they become. Thus, when one neuron fires, it is likely that others around it will fire depending on the strength of the firing (called an ‘action potential’), other activity in the area and the strength of the connection. Some

The Mindset of a Game Changer

'clusters' of neurons form the major brain structures like the occipital lobe, motor cortex or hippocampus which are responsible for particular behaviors. Other neurons reach from one end of the brain all the way to the other!

Already you can see how your brain is not always entirely under your control. If you see something specific, then this will cause certain neurons to fire based on your memories and understanding of that object. But it might also cause surrounding neurons to fire, depending on the associations you've formed during that life-time.

And when certain neurons fire, they cause particular emotions. That's because neurons communicate across synapses – small gaps between the end of one neuron (the axon – which is like a tail) and the dendrites (like arms) of another.

At the end of each axon is the synaptic knob, which is filled with chemicals called neurotransmitters, held inside 'neuro vesicles'. When the synapse fires, it causes these neurotransmitters to be released and that then alters the behavior of the transmission and the surrounding cells. Some neurotransmitters are **'excitatory'** and make other neurons more likely to fire. Others are **'inhibitory'** and make them less likely to fire – and more suppressed.

The Mindset of a Game Changer

Others have more complex roles. Some for example will make you more likely to remember something, while others will make you feel happy or sad. This is what controls the way you 'feel' about certain experiences.

It is important to know that neurotransmitters are also linked closely with your hormones. Some hormones act like neurotransmitters while some neurotransmitters can act like hormones. I know it can seem a little confusion but essentially, hormones are longer lasting and generally produced in the body, while neurotransmitters have shorter-lasting effects and are produced in the brain. Even hormones produced in the body are largely triggered by the pituitary gland, which is located in the brain.

Let's say you see a lion for instance, your brain will take notice and own to the associations you have formed with the lion. **Relevant neurons will fire and because those neurons are coded with danger, they will release a number of neurotransmitters like dopamine and cortisol to increase activity and say that something important is happening.** This increased activity causes more of the brain to light up and areas around the hypothalamus will then begin to trigger activity in the pituitary gland, producing adrenocorticotrophic hormone. The adrenal gland will also be triggered at this point, releasing the hormone epinephrine, which is essentially a form of

adrenaline. This is then what causes changes in the sympathetic nervous system.

This triggers physiological changes, including:

- The acceleration of the heart and lungs
- Vasoconstriction (thinning of the blood vessels)
- Dilation of the blood vessels leading to muscles
- Dilation of the pupils
- Inhibition of erection
- Sense of dread/anxiety
- Tunnel vision
- Thickening of the blood to encourage clotting after injury
- Pain reduction
- Contraction of the muscles
- Shaking

The Mindset of a Game Changer

- Suppression of digestion and immune function

Essentially, the body now directs all blood, oxygen, nutrients and resources to the muscles and the brain, in order to aid in combat, escape or other physical activity.

All this is involuntary and all of this is controlled entirely by automatic responses throughout your body. And it completely changes the way you now think and the way your body operates. It changes the way people see you and it drastically effects the way you perceive everything that happens subsequently.

But it's not just during times of high stress that uncontrolled changes throughout your body occur. There are many complex interactions of chemicals and hormones going on inside your body all the time. In the next chapter we take an even closer look at the power of neurotransmitters.

Chapter 2: The Power of Neurotransmitters

In the case described in the last chapter, we saw how releases of dopamine, epinephrine and cortisol among other neurotransmitters could result in the fight or flight response.

But something very similar, albeit much milder also happens when you experience chronic stress. Chronic stress is the kind of stress that 'doesn't go away'. This is not a lion but rather an impending deadline at work, wedding planning, property investment, debt, relationship problems...

The Mindset of a Game Changer

This triggers a very similar stress response, which results in continued changes in your body such as suppressed immune function and digestion, a certain amount of tunnel vision, dread and anxiety etc. So when you're stressed for long periods, this negatively affects your ability to relax and to enjoy any experiences – but it also impacts negatively on your health in more ways than you might immediately expect.

Dopamine makes us more driven and focused for instance but only on the thing that is causing the stress. This reduces activity across our brain so that we are more tightly focused on specific thoughts, emotions, ideas and inputs. There is something called 'eustress' or 'good stress' and it can actually be a good thing. But it has also been shown in studies to make us less creative because we're less able to let our mind explore different, diverse ideas.

Likewise, stress also makes it hard for us to focus on anything other than that thing that has our attention.

As you can see, the ability to control your stress response can be a fantastic asset and help you to focus more when you need to, to run faster and to fight harder – or just to appear completely confident and in control in stressful situations.

More Neurotransmitters and What They Do

Conversely, other neurotransmitters can be released in response to pleasure, exercise, sunlight, tiredness, darkness, excitement and more. And these all affect your mood and your ability to focus in other ways.

Serotonin is the neurotransmitter that we think of as the 'happiness hormone'. This is what makes us feel content and happy and it also has a range of other roles such as suppressing pain and decreasing appetite by stimulating the production of leptin.

Melatonin is the neurotransmitter that makes us sleepy!

GABA is an inhibitory neurotransmitter that reduces activity in the brain and can thereby suppress stress and further encourage sleep.

Dopamine is essentially a neurotransmitter that is related to goal-oriented behavior. It makes us more focused and increases memory among other things.

Acetylcholine is one of the principle excitatory neurotransmitters and also plays an important role in memory.

The Mindset of a Game Changer

Nitric Oxide is a vasodilator and helps get more blood to the brain and muscles. It also activates neurons that aren't directly connected and thus has an important role in helping us to wake up.

Testosterone is the 'male hormone' that is linked to aggressive thoughts and behaviors as well as drive and confidence.

Estrogen is the female hormone and can have a big impact on mood.

Cortisol is the 'stress hormone' and makes us more alert while creating feelings of dread. It's also linked with appetite, this time making us hungrier via another hormone/neurotransmitter called ghrelin.

Substance P is the neurotransmitter related to the transmission of pain. It also happens to be linked to anger according to some recent research.

Oxytocin, often called the 'love hormone', makes us more agreeable and creates feelings of loving protection and bonding.

Glutamate is another of the most abundant excitatory neurotransmitters and exists in vast quantities compared to any other neurotransmitter.

Anandamide is the 'bliss' neurotransmitter and also appears to stimulate creative thinking.

Once again, **these neurotransmitters are released in response to our experiences and thoughts.** When a mother sees her child, her brain floods with oxytocin which makes her more likely to bond with the child and feel the need to connect.

When you go on a rollercoaster, your body produces epinephrine and anandamide. When you have just had a great day out, you will be filled with serotonin and feel happy and positive.

In short, your happiness, productivity, creativity, attractiveness, relationships and much more are all responsible for different quantities of these various neurotransmitters.

Neurotransmitters for Incredible Abilities

Certain 'states' can be triggered via the release of specific neurotransmitters and this can be incredibly desirable/positive in some cases.

One example is the much-studied 'flow state'. **A flow state is a term for that moment when everything seems to fall into place and you are able to perform at your very best.** Game changers understand the importance of flow state. Flow state results in absolute focus,

heightened reactions, improved problem solving and more. It happens when you're snowboarding for instance and the world seems to suddenly slow down, allowing you to pull off incredible moves with expert timing. It also happens when you're so lost in your work that you forget to go to the restroom, eat or even look up from the computer. And it happens when you talk to a friend all night without realizing how long the conversation has been going. During a documentary, Beyoncé once said that when she is in her flow state, she forgets to eat, doesn't take a break and she also forgets that her staff needs breaks, need to eat, and go to the restroom.

In short, this experience is what total, creative focus feels like. And chemically, it is very similar to the fight or flight response but minus the sensation of fear or dread that normally comes from that. Instead, there seems to be a release of anandamide, which **enhances creative problem solving** while creating that sense of exhilaration that is so addictive to adrenaline junkies. At the same time, brain scans show that the prefrontal cortex – the part associated with planning and self-doubt – appears to shut down. This is what removes our sense of time passing and allows us to stay completely fixed on the moment. It's known as 'temporo-hypofrontality'.

The Mindset of a Game Changer

It is thought that all major athletic records were set by flow states and that most highly successful start-ups get to where they get to thanks to flow states.

So imagine if you could trigger a flow state at will and thereby achieve complete focus and perfect problem solving...this would be, for sure, a game changer for you.

The opposite of this state is what's known as the 'default mode network'. This is a network of brain structures that light up when we are completely lost in thought, often while our bodies carry out mundane tasks like showering. This is what allows us to explore diverse regions of our brains and find new connections between ideas – and it's what is believed to have helped Einstein dream up special relativity while working at the patent office.

The 'flashbulb memory' meanwhile shows us how our brains can be capable of laying down much clearer memories during times of extreme shock (such as the moment you heard about 9/11 for instance). Likewise, 'hysterical strength' shows how a strong enough fight or flight response can actually increase muscle fiber recruitment to the point where women have been able to lift cars off of their children trapped underneath.

The Mindset of a Game Changer

Basically what I am trying to tell you is that your brain has enormous power and if you could learn to leverage it's power you would be unstoppable.

One underground movement that is interested in the idea of using neurotransmitters to accomplish more is the 'nootropics' movement. Nootropics are 'smart drugs' which tend to work by blocking certain neurotransmitters and encouraging the production of others. These can work like the film 'Limitless' but on a much less powerful scale – slightly increasing memory, focus or even confidence.

The problem with nootropics is that they often come with side effects, haven't been tested in the long term and generally make it harder for us to switch mental state as we need to. It's no good being highly focused if it means your creativity will be suppressed!

Luckily, there are other ways to encourage the production of the correct neurotransmitters to invite the mental states we want and I'm excited to share these strategies with you in the next chapter.

Chapter 3: Improving Your Mental Health with the Right Food and Sleep

Dr. Gelhot, our family doctor, takes extreme interest in my health and well-being. She has invested hours at a time to help me understand preventative strategies I can use to feel better and function better.

What's key to understand here is that it's not just our thoughts that lead to these changes. Just as important is our biology and our lifestyle and our bodies and minds exist in a tightly linked cycle of activity.

For instance, when you eat, this results in an increase in serotonin. Why? Because foods – especially carbs – contain an amino acid

called tryptophan. When blood sugar increases, the body responds by releasing insulin which triggers the absorption of glucose from the blood to be used for activity or stored as fat. But tryptophan does not get absorbed and as such, it remains in the bloodstream. This then gets circulated to the brain, where it is converted into serotonin – that's because tryptophan is a precursor (building block) for serotonin.

This is why your mood tends to improve when you've eaten. And this then results in the release of ghrelin to signal that you're getting fuller and to prevent you from over eating.

Later on, that serotonin converts into melatonin – the sleep hormone. This is why everyone falls asleep after Christmas dinner! That melatonin reduces activity in the brain and this then triggers the release of other inhibitory neurotransmitters like GABA.

Did you know that darkness also triggers the release of melatonin?

And meanwhile, the longer you stay awake, the more adenosine (another inhibitory transmitter) builds up in the brain. This is partly what gives us 'brain fog' after a long hard day because it is a by-product of the energy process used in brain cells.

What all this means, is that after a long day and big meal, you are sure to start getting tired at the end of the day and find it harder to

wake up and do something productive. That's not you being lazy or disinterested, that's you being at the whim of your biology.

Now let's say that we want to wake ourselves back up. What do we do? One simple option is to go outside or shine a bright light – sunlight triggers the release of cortisol, which along with nitric oxide will help to wake us up. This is why we should avoid looking at phone screens when we're getting ready for bed.

Or how about jumping in a cold shower? This stimulates the release of epinephrine, norepinephrine and testosterone – waking you up and making you much more focused. It's the adrenaline that causes the hairs to stand up on your body.

Loud noises can create enough shock to wake you up and so too can hunger. When we're hungry, we have low serotonin in our brains which in turn increases the cortisol – stress hormone – ratio. That's why we get anxious when we're hungry and it's why some people also get 'hangry'.

There are all kinds of other interactions like this that can have a huge effect too. For instance, as pain is linked with anger, this explains why we're cranky when we have aches and pains.

Making Use of Your Biology

So now that you have a PhD in Neuroscience (LOL) what can you take from all this?

For starters, it's useful to recognize the role of your natural ebbs and flows and your biology. In other words, try not to get too alarmed if you find yourself feeling very stressed or very tired. Likewise, try not to let anger cloud your judgement. Often we will shout at our loved ones when we're angry or stressed partly because our perception of events has changed and had a negative slant.

This also means there are many ways you can 'fix' your mental state. You can wake yourself up with a cold shower and some blue light (blue light being the term used to describe light with the same wavelength as the sun). If you're in a bad mood, then you should try to increase serotonin which you can do with food – or more sensibly by increasing vitamin C. Something else that triggers the release of serotonin is exercise! This is what causes what we know as the 'runners' high'.

If you want to perform at your very best, then use this information to try and improve your sleep. This will help you to wake up with your brain feeling far more refreshed and with much less 'brain fog' slowing you down and making you groggy.

Want to be more productive in the evenings? Shift dinner back half an hour! Likewise, recognize that you're less likely to be productive right after you've eaten at lunch. Conversely, if you're going to try and think creatively – do it when you're relaxed and calm.

Combating Stress

Also useful to know is that you can use your body to calm stress and even eliminate what would otherwise be a panic attack. That's because our sympathetic nervous system – which controls our fight or flight response (as well as our opposite 'rest and digest response') – is tightly linked with breathing and heart rate. When you breathe quickly, it makes you more stressed and increases your heart rate.

Conversely though, if you breathe more deeply and more heavily, this helps to encourage a much calmer response and puts you more in the rest and digest state. Breathing deeply is thus one of the best ways to calm yourself down and one of the best ways to prevent serious anxiety.

How to Upgrade Your Mental Energy

What's most important, is that you have the right diet and that you are in good shape. This will transform the performance of your brain by drastically increasing the ability to create neurotransmitters as needed and by increasing the amount of energy your brain

receives. You can't make game changing moves and have a game changing year without taking care of your body.

One way to do this is to consider using some form of multivitamin tablet. This should contain vitamins like B12 and B6, which are used to supply the brain with energy as well as to help create a large number of neurotransmitters. Also used in the creation of many neurotransmitters and hormones are vitamin D, vitamin C, magnesium, zinc and more. Dr. Gelhot has really helped me define a supplement regimen for optimal health.

If you make sure you are getting these in your diet, then you will find it easier to switch from being highly focused to being relaxed and creative and you will find your brain lasts longer before getting tired. Also particularly important is choline, which is a precursor to acetylcholine found in eggs – this can help improve your sensory perception, your alertness and your memory all at the same time! Amino acids found in protein are also critical for a wide range of neurotransmitters.

Other nutrients that are very important are those that improve the energy and function of the brain. Any vasodilators for instance, such as garlic, will help to get more blood and more oxygen to the brain helping you to stay alert for longer. Creatine is a bodybuilding supplement also found in red meats and this is great for reducing

adenosine and also increasing mental energy – studies show that this alone can be enough to boost IQ! Omega 3 fatty acid improves cell membrane permeability, which means that neurons are better able to communicate with one another. Exercising regularly will help you to create more neural connections in your brain, increasing your ability to learn via heightened plasticity (and brain derived neurotrophic factor). This will also increase your body's energy efficiency and help you to experience less stress.

In short, **it is highly important to eat a nutrient dense diet and to train hard if you want to perform at your mental best.** Get more nutrients and substance, avoid junk food and 'empty calories' (which spike the blood sugar and throw our entire system out of whack), sleep well, run and lift weights.

As you do this, your brain will instantly start to become stronger, more efficient and less groggy. And your performance and productivity will also grow to reflect that.

Chapter 4: Mindfulness and CBT for Improving Your Mindset

By using the techniques in the last chapter, you'll find you're able to increase your wakefulness, your mood and your general performance on a regular basis.

But now we come to **the next game changing strategy – changing your mood instantly and switching from one mental state to another.** What we really need to be able to do in order to perform at our very best is to switch to a stressed and motivated state when something requires our attention, and relax from work when we get home in order to allow our brain to recover and to actually enjoy ourselves.

Having an understanding of our neuroscience will help and so will having a good foundation of health. But now I want to teach you how to take full control of your mental state and your attention.

It's All About Perception

As mentioned earlier, your experiences are largely what control your emotions. Simply seeing a lion is enough to trigger a cascade of different changes in the brain that ultimately result in you becoming highly aroused both mentally and physically.

When tired, you could wake yourself by taking that cold shower or by seeing a lion!

But what if the lion wasn't there and you only thought the lion was there?

What if the lion was there and you didn't see it?

Ultimately, it is not the actual lion that triggers the response but rather your perception of that lion and your beliefs about the lion.

Put it another way: if you were to see a lion and you didn't know what a lion was, then you probably wouldn't have the same fight or flight response – you might even think it looked cute and get an oxytocin release instead!

It's your understanding of the situation that impacts on the way you react to it and this in turn changes the way you feel and the way you behave.

And this is actually what happens all the time throughout our lives to a lesser extent. This is why some people are calm and relaxed all the time (we call them 'laid back') while other people are constantly stressed and anxious.

Let's imagine you're in your office and you have a very tight deadline that you don't think you can meet. You may either begin to feel incredibly stressed and thus experience that fight or flight response. Or you might not have that response at all and you may instead find you're able to stay very calm and collected.

There's of course an ideal middle ground here – being too stressed is bad for your health and can actually cause you to become less productive in some cases (the response is sometimes actually referred to as the fight, flight or freeze response!) while being too relaxed as mentioned can cause you to end up not actually doing anything about the situation.

The simple fact of the matter is that in these situations, **some people see a lion and some people see a cat.**

The scenario is precisely the same but their reaction to that situation can be very different. This is based on your life experiences, diet, health and personality – but you can take control of it once you know how.

The Idea Behind CBT

CBT is 'cognitive behavioral therapy', which in turn is a type of psychotherapeutic intervention that is based almost entirely around the concepts we've just discussed. This asserts that our behavior is a result of our associations (this is behaviorism) and of our thought processes that actually allow us to reinforce an idea in our heads.

So when faced with a stressful situation, you will be stressed partly because of the beliefs and associations you hold regarding that situation. At the same time, you'll then start playing out what you expect to happen in your head and when this happens, areas of the brain fire almost as though that thing were really happening. You might imagine getting fired, having your house repossessed, or being injured depending on the scenario.

The Mindset of a Game Changer

This then causes the release of even more stress hormones, just as though you were really in those situations and you can end up anxious, aroused and potentially less effective. This is where a lot of phobias come from but it's also what can make us less self-confident, less likely to take positive risks and generally less successful than we otherwise could be.

So CBT aims to change this, partly by creating new associations and partly by changing the way you think and changing what you're visualizing. There's more to it than that of course but this is the central concept and the tools used to this end are collectively referred to as 'cognitive restructuring'.

So let's say that you want to be calmer at work, or you want to overcome a fear of heights. How might you do that using CBT?

The first step would be to become more aware of your existing thoughts, beliefs and emotions. You can do this in a number of ways. One common tool is journaling, whereby you keep a journal of your thoughts, feelings and emotions pertaining to the thing that frightens you. This way, you can really deconstruct the thought process that is leading to your fear.

Another option is to use mindfulness. This is a form of meditation that doesn't focus on making your mind blank but instead focusses on

letting your mind become detached while you watch the contents of your thoughts. This process in itself is very calming and can help to prevent a fight or flight response.

Once you have the thoughts that make you stressed– or you're aware of what you're visualizing – you can then focus on deconstructing them. For example, if you're afraid of public speaking then this might mean that you picture yourself stuttering and being laughed at. If you're afraid of heights, you might think things like 'I'm going to fall'.

What you don't realize is that simply thinking these things strengthens those neural connections and coding the experience as 'bad' and 'dangerous' making the response stronger in future.

So now you're going to unravel those beliefs and try to remove them.

One way to do this is with 'thought challenging'. **Thought challenging essentially means that you're going to really analyze your belief and decide if it might actually be true or not.** So if you're afraid of being laughed at on stage, you're going to think about how likely people really are to laugh at you and whether or not this is something that you would do in their position. The reality is that most people are kind enough and mature enough to just politely wait for you to get it back together. If anything, they are likely to sympathize with you.

You can also help this process by coming up with contingency plans. In other words, if you do stutter, what can you do to make it less devastating? You could make a light hearted joke of it to ease tension!

Question: Do you really care if these strangers who you'll likely never see again think any less of you?

Another scenario might be low level anxiety that you're holding about your job because you're afraid of being fired. Let's say you made a big mistake on a report that won't come to light for two weeks – now you're worried you'll be severely reprimanded.

So let's address this situation logically with thought challenging: is your boss really that harsh and unfair? Aren't there laws that would protect you? Can't you explain that it's an honest mistake? Could you blame it on your tiredness or stress at the time? If you really did get fired, wouldn't you likely be able to land back on your feet? Now picture the way it's much more likely to go and let that sink in.

Suddenly, it's not so scary.

In both of these situations you have taken that mental lion and turned it into a small kitten! You've neutered the dragon and you can thus remain much calmer thanks to your new perception of the situation. And the more you practice this, the more you'll find you

start to adopt it and it starts to become a part of who you are. Suddenly, you'll be able to stay calm and collected during all kinds of crises at work and eventually people will start to turn to you for advice whenever something goes wrong!

Another tool is even more powerful than this and it's called

'hypothesis testing'. The problem is, that in order for you to really be able to overcome a fear or phobia, you have to really believe what you're thinking and visualizing. It's not enough to just keep saying that it's a cat and not a lion – you have to really believe it right in your heart.

So the next logical question at this point, is how you can convince yourself of your new thoughts and beliefs. And one way to do that is to use hypothesis testing – simply proving to yourself that your old beliefs were wrong and your new ones are right.

In the case of the person afraid of public speaking, what would that mean? It would mean actually making a mistake in public on person – or even standing there not saying anything for a while. You're facing your worst case scenario, trailing the worst outcome and hopefully proving to yourself that there's actually nothing to be afraid of. In doing this, you should find that no one laughs and people just wait politely. At this point, you now know that your fears

were unfounded and you will find they bother you much less in future.

This is also a little like reassociation or exposure therapy. By consistently exposing yourself to the situation you used to be afraid of, you can create new associations and remove those old negative ones. You can even eventually become desensitized as you learn that there's nothing to be afraid of. I've seen a paratrooper whose heartrate remained at 60bpm throughout the entire jump. Why? Because he'd done it hundreds of times before and his body knew that this was nothing to be afraid of.

You can work your way up to this if you're unsure but just exposing yourself to these dangerous situations will eventually be enough to help you overcome an unwanted physiological response.

One of the most powerful and effective uses for this? Becoming socially bulletproof. Almost all of us have some kind of natural anxiety when talking to strangers and this causes us to have a minor stress response.

But if you keep exposing yourself to new social situations and even make them purposefully awkward, then eventually you can completely get rid of any anxiety you previously felt at all. Try going to a shop (not one near you) and ordering your items in a funny

The Mindset of a Game Changer

accent. You'll find they politely nod and give you your things without saying anything. The more you do this, the more accustomed you'll become to speaking with strangers and the less of a stress response you'll have in future.

By the end, you'll find that you're perfectly able to speak with complete, calm confidence in almost every situation!

Chapter 5: The New You – Dressing for Success and More

Earlier we discussed how to become less stressed at situations that may surface in your career – by using thought challenging to break down the worst case scenarios and by coming up with contingencies. You've changed your perception of the situation by applying a little logic and in doing that, you've become much more calm and composed. We've also seen how we can change our response to new social situations, making ourselves incredibly calm and relaxed when talking to new people so that we come across as fearless.

This is where things start to get really interesting and where we move into really thinking like a game changer.

In the introduction, I mentioned very briefly the 'law of attraction'. We saw how simply changing the way you feel about yourself would also change the way that others react to you. Let's take a look at that in some more detail...

What is the Law of Attraction?

It might seem strange but most people will buy more expensive gifts for their wealthier friends. This is proven by statistics and surveys and it's surprising seeing as you'd think they'd want to buy more expensive items for the people who couldn't afford them on their own.

But the reality is that wealthier people have more things and have a more expensive quality of item on display. To get them something they'll like and to get them something that will fit in, we need to spend more on them.

This is an incredibly simple example of the law of attraction working. When you have more nice things, you actually attract even nicer things to you.

The Mindset of a Game Changer

The same happens with money – you have to spend to accumulate and simply having more money means you'll make more investment.

But it also works with what you believe about yourself and how you act. If you believe you're highly capable at your job, if you genuinely aren't stressed by things going wrong and if you act accordingly; then you'll quickly find yourself rising and stepping up to your next level of success. When you have belief in yourself, so do other people.

One reason for this is that confident people tend to look more confident thanks to the way they dress and act. If you are very confident you might walk with a straight back and chest puffed out and you'll probably buy nicer clothes and spend more time on your hair.

Simply doing this will make you look like someone who is more important and who is more successful. Now other people will assume you are more important and more successful and unconsciously your bosses will be more inclined to want to give you more responsibility or your potential clients will be more inclined to work with you.

It doesn't take long until doing all these things will make you the ideal candidate for that raise or promotion and then you become more successful.

The same is true for a guy approaching a woman for the first time. If he doesn't believe in himself and hasn't trained himself to be calm and relaxed, then he's going to be sweaty, nervous and unattractive as a result. If he comes over and he believes in himself though and can control his stress response, he's going to seem fun, confident and therefore attractive.

On an unconscious level, he is sending a signal to the woman that he is a good genetic bet for her offspring – he must be or why would he be so confident around her? There's obviously something about him that makes him confident, whether that is wealth, strength, health or intelligence. This makes him more attractive and the woman's neurotransmitters do the rest. Hello oxytocin, hello testosterone!

Change from the Outside In

We've focused a lot so far on how to change your mindset from the inside out but you can also change it from the outside in. How? By simply treating yourself better – dressing better, looking after your health and investing some cash in your own happiness and your own development – you can help yourself to feel more confident and look more confident to others.

The Mindset of a Game Changer

There's an old saying that you should 'dress for the job you want'. Likewise, it they say that the amount you spend on your haircut directly correlates with the money an employer is likely to entrust you with.

So spend that bit of time in the morning to make sure you're looking your best. Exercise. And take care of your health. Women – try wearing a bold shade of lipstick to show that you're not shy and not content to shrink into the corner. Guys – don't go into work without bothering to iron your shirt, it just sends a signal that you don't respect yourself enough to bother – or that you're so disorganized that you couldn't find the time or the energy to do it.

Changing from the outside in is never enough on its own. **But when you change both inside out and outside in, then you'll find the change is even more astonishing.**

Chapter 6: How to Think About Failure and Risk the Healthy Way

Earlier, we discussed the powerful impact that just being a little more logical about stress at work could have on your success. We then looked at the law of attraction and at how this makes you far more successful over time as people look at you as the person who is calm and in control.

But why is this? Why is it that most people aren't better able to control their emotions and stay calm? Why is 'panic' our default response?

The Mindset of a Game Changer

The answer is that our emotions have evolved in a much more dangerous time than we live in today. We are naturally risk averse because that is the attitude that would have given us the best chance of survival out in the African Savannah.

Let's say you see an animal on the horizon and you don't know if it's a cat or a lion. In the wild, it really wouldn't make sense to treat the unknown as a cat. Rather, it makes much more sense to assume the worst and to run.

But today that's just not the case. Today, the 'worst case scenario' is really not that bad and is certainly not severe enough to put you in physical risk. The worst case scenario is your boss shouting at you, losing an important client, or a short period of financial hardship.

Risk aversion then is what gives you your advantage once you can get over it and it's what will help you to seem the calmest and to make the 'brave' decisions. At the same time, it can be very beneficial to apply a little cognitive restructuring in order to change the way you perceive risks and challenges more generally. Think of these as opportunities to learn and to grow, to become stronger, and to give life some interest and excitement. When you look at them like this, you'll be able to thrive rather than collapse under pressure.

Very often, it's taking risks to ask someone out, invest in money, quit your job and start your own business, propose to your partner... all these things that give life meaning and color. And even if they go wrong, at least you tried.

And **if you don't learn to perceive challenges this way? Then the stress will never go away.** There's always an underlying sense of stress because that's human nature. The hedonic treadmill is a state of perpetual discomfort that we all tend to fall back to, even when times are good. It's what is believed to keep us working and trying but an unfortunate side effect is that we are never quite content and never able to really try anything bold and brave.

The REAL risk is that we stay frozen by fear, or that we stayed weighed down by all the admin of everyday life. The real danger is that you stay doing the same job that you don't enjoy every single day and that you never experience the contentment, the challenge or the beauty that life has to offer. **That's what you should be stressed about, and you should use that to push you towards your goals – even when life is hard and life is stressful.**

Chapter 7: How to Know What You Want and Go After It

In the last couple of chapters, we've focused on using CBT to reduce stress. And we've seen how this can indirectly lead to advancements in your career or growth for your business thanks to things like the law of attraction.

But what about motivating yourself toward something? What if you're not frozen by fear and stress but simply by tiredness and indifference? What if you don't know what it is you want out of life, or how to structure a goal so that you can get there? **You can't work toward what you want when you don't know what that is!**

Vision, Not Goal

The first thing we're going to do is to introduce just a very subtle shift in the way you approach these ideas. And specifically, this will mean having a vision and not a goal.

What is the difference between a vision and a goal? A vision is much more abstract but at the same time, more tangible.

A goal is to lose 1 stone in 10 weeks. A vision is to be the same you, but fitter, healthier and more successful. Imagine waking up every morning with tons of energy to get up and attack the day.

Which of those things is more motivating? For most people, the answer will be the vision.

The other great thing about visions is that most of us already have them, even if we don't know it. If I ask you what your goal in life is, then you might not be able to answer. But if I ask you to just imagine your perfect life, then you might find it easier to do. Perhaps you're sitting on a beautiful beach somewhere? Perhaps you're living in a massive mansion? Maybe you're rich in a skyscraper somewhere?

If you're still struggling to come up with a vision that you can work toward, then some other questions to ask are things like: who are your role models (and what do they have in common)? When was

The Mindset of a Game Changer

the last time you were truly happy? What did you want to be when you were a kid?

It doesn't have to be super concrete – wanting to be wealthy, wanting more time with your family or wishing you weren't at work is fine! And if you do have something really concrete – wishing you were a world famous speaker – then that's fine too.

From here, the next thing to do is to take that vision and break it down into steps. This is another important point and it's once again something that a lot of people get wrong. If you are working toward a goal rather than a vision, then you might, as per my previous example, be working toward losing X amount of weight in N amount of time.

This is a fine aim but it's far too distant and too outside your control to be useful. When it comes to the crunch and you need to force yourself out the door to exercise, it's all too easy to just tell yourself you'll catch up on what you've missed later. You end up putting it off or making excuses and by the time that amount of time has passed and you haven't achieved what you were hoping, you just feel disappointed, disheartened and possibly depressed. Eventually, this leads to you giving up entirely!

The Mindset of a Game Changer

So instead, we make steps toward our vision. This means coming up with a plan first and often you'll find it's easier than you think to accomplish the impossible – it just requires a bit of creative thought. For example, if you want to be a world famous speaker, you might take a less obvious route such as creating your own YouTube channel and posting your speeches. If you build up a big enough following and you have enough talent, then eventually this is likely to lead to an offer for a speaking engagement!

In other scenarios it might be a very easy set of steps – in order to lose weight, you might eat no more than 1800 calories every day and workout five times a week for 30 minutes. If you want to write a best-selling novel, your goal might be to wake up one hour early and write for 40 minutes before work.

These are now incredibly simple steps that are highly within your control. You either fail or pass but it's entirely down to you. And if you do fail? You can simply try again the next day. Each day is a fresh challenge and there is no putting things off. Ultimately, this makes a goal much easier to stick to – especially if you use the chain technique a lot of people use: creating a string of X's in a calendar so that you will find yourself not wanting to break the sequence by missing a workout or writing session!

The Mindset of a Game Changer

This will seem detached from the goal at times but if the steps are good, then taking them every single day, week or month on a consistent basis will mean you're getting gradually closer to your aim.

Now all that's left is to motivate yourself and to get yourself in a mindset where you're willing to put in the time and work to get to where you want to be. How do you get yourself to get out of bed to go for a run at 5am when it's pouring with rain outside?

The answer is that you need to use a slightly altered form of CBT by **focusing on the emotional reasons behind what you're doing**. In other words, you need to think about the vision and you need to feel the vision. This is what will give you the release of the correct neurotransmitters to have the motivation to do it. You can also focus on what it is you're trying to avoid.

So if you're thinking about running in the morning and you can't find the willpower to do it, the answer is just to make the connection in your mind so that you link that step to the outcome you want. Visualize that version of yourself who is fit, healthy and ripped and picture yourself running in the sun during the summer. Think about how it feels to never have this low energy and think about the alternative – getting gradually less and less fit and feeling gradually worse and worse with nothing that you can do to fix it. And if you try

The Mindset of a Game Changer

this a few mornings and you find it doesn't work, then another consideration is to try setting yourself up some kind of video or script that you can read or watch when you wake up to do that for you. Feel the emotion, know that the step you're considering is what can get you there and then take the next step!

Chapter 8: 5 Powerful Exercises for Increasing Your Confidence

One of the most powerful assets in your mental arsenal is to increase your confidence – to feel good about yourself so that you can attract the things you want and so that you can come across as being in charge and being passionate about what you're saying.

But if you're naturally someone who struggles with self-confidence, how can you simply 'switch off' that self-doubt and become more confident. **Confidence is what turns thought into action** – which is what we're really talking all about.

Understand What Confidence Is

Confidence is a very broad term that gets thrown about without a lot of thought. This is a bit damaging because we tend to think of it as a single term that encompasses so much about who we are. We either have 'good confidence' or we have 'bad confidence'.

In reality though, confidence is much more contextual than that. You can be confident in one domain and you can lack confidence in another. Maybe you think you're bad at math but you know you're a fantastic writer – does that make you confident or unconfident?

So you can make yourself confident simply by focusing more on the things you're good at in order to spend more time 'at the top of your game'. At the same time though, you should also make sure you remember that your ability can improve in most areas. If you think you're 'bad' at something, then remember that you'll get better with practice and that everyone is bad at something to begin with. We've seen how neuronal connections strengthen as they fire and this is how you can become great at any given sport or activity over time.

What about your looks? Well, you can improve those in a lot of ways too. But it's also useful to remember that everyone is different and that beauty is a very subjective matter. If you focus on your good

qualities and own what you've got, you'll be magnetic to a lot of people.

Take Challenges

As mentioned, it's useful to learn and to develop the things you're not good at. This is why the hypothesis testing to become socially bulletproof is so useful – you're exercising your social skills, just like you exercise a muscle.

As you get better in these areas, you'll find that your confidence naturally improves because you have more things you are good at and fewer areas that you consider to be flaws. But more important than this even, is the psychology of simply trying new things and taking on new challenges. **Each little 'win' will flood your brain with positive hormones and reward you and that will make you more inclined to try again.** Try learning small things like playing the piano or learning to count in another language, each time you have a little victory it will improve your confidence and help you become better at taking on newer challenges.

Meanwhile, the failures you encounter will help to make you more accustomed to sometimes picking yourself back up and more desensitized to the feeling of failing at something. Again, this builds confidence.

If you're looking to increase social confidence and self-worth, one of the very best things to do is to throw yourself into a challenging and outward-facing job. You'll then have no choice but to make calls, and learn new things and each time you do, your esteem will grow.

Visualize Success

Before trying something new, visualize yourself succeeding. This can help you to activate brain areas as though you really had succeeded and that will help to quash any doubt and boost your confidence. You can enhance this further by listening to some empowering music and reminding yourself that it's a challenge and not an obstacle.

Better yet, if you keep practicing this it can eventually become habit – meaning that you'll automatically visualize yourself succeeding in future when taking on any new challenge!

Power Poses

Power poses are positions you hold that have been shown to boost testosterone and thereby confidence. Try standing up and holding your arms over your head in a 'V' shape as though you had just crossed the finish

line in a race. This is a universal stance that symbolizes success and it can really help to increase your drive and determination.

Invest in You

Finally, invest in yourself. If you treat yourself well for long enough, you will feel as though you deserve to be treated well. What's more, wearing nice clothes, maintaining good health and having a great home all help to build that internal picture of who you are and give you more self-esteem. It's not a waste of time and money to buy a good suit – it's an investment.

I've actually got one more strategy for improving confidence and I'll share that in the last chapter!

Chapter 9: How To Maintain a Positive and Happy Mindset

Everything we've looked at already should help you to find the things you want in life and to go after them. But what about being happier the way you are right now?

Because that's the thing. **A lot of us don't realize that we could actually be very happy with what we already have.** We see lions everywhere where there aren't any and our society is designed only to encourage this further. In reality, you can be frugal and be incredibly happy. How about moving to a poorer area and seeing your money go much further? And instead of spending lots of money

The Mindset of a Game Changer

on games and films, how about going for walks, exercising or even visiting free museums? A book on Amazon costs \$1.00!

One study demonstrated this incredibly well. The research essentially gave lots of people a test to measure their happiness. Among the participants, some people had terrible luck – losing partners, losing limbs, contracting terminal illnesses – and others had much better luck by winning the lottery or marrying super models. Right after these life events, their happiness was measured again and as you would expect, lottery winners were happier than amputees!

But now fast forward 10 years and what they found was that the happiness evened out again. This is once again what's known as the 'hedonic treadmill'. It's a consistent sense of mild dissatisfaction that keeps us motivated and that prevents us from appreciating what we have.

The problem here is focus. And this is the final piece of the puzzle when it comes to becoming your best self, living audaciously and making 2017 your best year ever.

If you choose to focus on the negative things in your life, then your life will always be negative. If you focus on stress, you'll always be stressed. But focus on the things you have and take the time to actually be mindful about your accomplishments, your good health

and all the things you have to look forward to and suddenly you can be a lot happier.

It's even possible to reduce pain by not focusing on it – which is how meditation can be used as a form of painkiller among those who are incredible experienced at it.

And this is also that other way you can boost your confidence – focus on the things that you like about yourself and all your accomplishments rather than the things you don't like about yourself and over time, you'll start to feel much more confident and much happier.

The Gratitude Attitude and Other Techniques

To make sure you start feeling happier and more grateful about all those things you already have, consider trying to cultivate a gratitude attitude. The most popular way of doing this is through journaling – every night try to write down three things that you are grateful for and take a moment to reflect on this. With time, you'll find that this makes you much more aware and much happier about everything in your life.

Another method is to try focusing on the things you're looking forward. We tend to dread things we don't want to do but how about instead you focus on things like your birthday, that new movie

The Mindset of a Game Changer

you want to see, that new book you want to read, or even your favorite cereal tomorrow. Doing this gives you more to live for and helps you to look forward to the next day.

And to make sure you have lots of things you can do without spending a fortune or getting stressed, try writing down ideas for activities as they come to your mind.

For boosting confidence, try writing down all the compliments that people pay you. Every time someone says something nice, remember it and then write it down. Every now and then you can read through this booklet and relive all those compliments!

Likewise, you can also use thought challenging to break down incorrect beliefs about yourself. If you feel you're unattractive, then write down the things that you know are attractive about you – things no one can argue with.

To choose how you want to feel, you just have to decide what you're going to focus on and what's going to get most of your attention.

Conclusion and Summary

A lot of this takes practice and comes with time, so don't worry if you haven't transformed yourself overnight. The first step though is simply recognizing that all this comes from within.

Your happiness, your goals, your fears, your drive, your personality... all of it is based on how you direct your attention and interpret what's happening. **Once you learn to go against thousands of years of evolution and take control of your emotions and neurotransmitters, suddenly they become a powerful tool that you can use to get a competitive edge in any aspect of your life.**

The Mindset of a Game Changer

You can be happier, more focused, more confident and more efficient and driven. And when that happens, everything changes – the way people see you, the way you feel about yourself and the way opportunities start to present to themselves.

So where do you go from here? How do you start putting all this into action? I have included resource sheets and cheat sheets to help you take the next steps but for now, try to think more about any of your thoughts that are holding you back.

When are you focusing on the negatives instead of the positives? What is causing your anxieties and fears? Write down your emotions and your thoughts and then challenge them – break them down on paper and test them where necessary.

Next, start to think about what you want to get out of life. Have a vision and not a goal and make sure that you live in that vision. Feel the emotion that comes from your vision and let it drive you so that you take each necessary step to get there.

But don't forget to smell the roses along the way! Be mindful of the things you've already accomplished and the things you're grateful for. The real trick is to learn to be happy with who you are and to enjoy every challenge that life throws at you!

Appendix A - Conclusion and Summary

Now you've read the Mindset of a Game changer eBook, you should have a much better idea of how your brain works and how you can leverage the power of your brain to start getting more of what you want out of life.

But that was an awful lot of information to take in in one go and so it may be hard to know precisely where to start. This checklist will serve as your simple guide then to walk you through each stage and help you to put those changes into action.

Understand Your Brain Better

The first step is to cultivate a better understanding of your own mind. Your brain is a complex and wonderful place and you need to understand how its whims affect your life. Some points to consider:

- Your brain is made up of a web of interconnected neurons called your 'connectome'
- Your experiences are coded by these neurons and when one fires, you experience it

The Mindset of a Game Changer

- When neurons repeatedly fire at the same time, a connection between them forms
- Neurons release neurotransmitters when they fire which act like hormones to affect our mood and our mental state
- Dopamine increases motivation, focus and memory
- Acetylcholine affects awareness and memory
- Serotonin puts us in a good mood
- Melatonin makes us sleepy
- Adrenaline makes us alert, driven and aroused
- Oxytocin is the love chemical
- Adenosine creates the sense of bliss and encourages creativity
- Cortisol is the 'stress hormone'

The Mindset of a Game Changer

You also need to recognize how your mood differs depending on various physiological changes. The way you breathe, the time of day and whether you have just eaten will all impact on your mood and your focus.

Try to remember that sometimes your bad mood is not a reflection of your actual thoughts.

Likewise, try to time your productivity to fit with the points where you are naturally most productive!

Also, look after your mental and physical health:

- Eat cognitive metabolic enhancers

- Fuel your neurotransmitters with amino acids and vitamins/minerals

- Get plenty of sleep
- Exercise to fuel your brain with energy

Set Your Vision

The Mindset of a Game Changer

Before you can start changing your mindset to accomplish what you want, you need to know what that is!

- ❑ Don't set goals, set visions

- ❑ Work out a plan – break that vision down into concrete steps you can take to get there

- ❑ Look at the beliefs and fears that are limiting you and preventing you from getting what you want

Cognitive Restructuring

You can remove those negative beliefs and go after you want by using cognitive restructuring. This means:

- Addressing your thoughts and reflecting on your beliefs

- Using 'thought challenging' to assess whether you really believe those thoughts

- Look at how likely your fears are to become reality
- Think about if it really matters

The Mindset of a Game Changer

- Come up with contingency plans
- You can also use 'hypothesis testing'
- Simply test yourself by putting yourself in the situation you are
- afraid of
- And 'reassociation'

Likewise, you can also use something similar to mindfulness in order to help motivate yourself toward goals and tasks that you're finding it hard to work on.

For example, this might mean really visualizing that 'vision' and focusing on the emotion behind it. Why is it you want to go after that thing? How would success feel? Why does this matter so much to you?

The Law of Attraction

Invest in yourself! Dress the part, look the part and exercise. This will help you to feel more confident and that in turn will come across in the way you walk and talk.

This leads to the 'law of attraction' whereby people start seeing you differently and treating you differently, thereby helping you to accomplish the very things you've been acting like you already accomplished.

Gratitude Attitude

Finally, practice cultivating a gratitude attitude. This means focusing on the things you're happy with and what you already like about your life.

This is very important because it will ultimately be what helps you to appreciate the things you already have. Without this, you can work as hard as you like and accomplish everything you set out to but still not really be happy. In that way, the gratitude attitude is the most important mindset shift of all!

Resource Cheat Sheet

Changing your mindset is the single best thing you can do to start getting what you want in life. Everything you accomplish starts with you and starts with the way you think and feel, if you can change your goals, your conviction and your response to tough situations, then you can set yourself on the right course and make sure you reach the destination.

We've looked at how you can start changing the way you think and taking control of your mind in the full book *The Mindset of a Game Changer: How to Become Your Best Self, Live Audaciously and Make 2017 Your Best Year Ever!* But you mustn't rest on your laurels just yet: changing your mindset and taking control of your brain is always going to be an ongoing process. Read on then and we'll look at some of the resources you can use to keep your mind under your strict control.

Further Reading

There are a ton of great websites and books that deal with mindfulness and CBT. Some of the best for your further reading include:

The Four Hour Blog

(www.fourhourworkweek.com/blog)

This is the blog of author Tim Ferriss – who wrote *The 4 Hour Workweek* and *The 4 Hour Body*. Tim is all about changing the way you think in order to live a happier and more productive lifestyle. Tim recommends changing the way you think about taking risks, about going after what you want and more – and he uses all this advice to help you craft the perfect lifestyle you've always wanted.

The Rise of Superman: Decoding the Science of Superhuman Performance

The Rise of Superman: Decoding the Science of Superhuman Performance is a book by Steven Kotler detailing lots of examples and information regarding the quasi-legendary 'flow state'. A flow state is a state of mind in which time and distractions seem to fall away and we are able to react faster and with pure focus. Steven talks about how we can tap into this state a little more often.

Brain Pickings

(www.brainpickings.org)

Brain Pickings is a website from Maria Popova that features a lot of fascinating posts on philosophy, politics and – yes – the brain. This

isn't so much a site that gives you tools as much as a site that encourages thoughtful reflection.

The Bioneer

(www.thebioneer.com)

The Bioneer is a biohacking website that focusses on training both the body and mind. It includes in-depth posts on neuroscience and CBT, as well as posts on physical training, technology and lifestyle design.

The Bulletproof Exec

(www.bulletproofexec.com)

The Bulletproof Executive is a website about using nootropics, healthy eating and bio hacks to be more productive and efficient. It has some good ideas but you should also be aware of some of the snake oil products being sold here. Stay away from Bulletproof Coffee!

Steve Pavlina

(www.stevpavlina.com)

Another one of the big productivity gurus online is Steve Pavlina. Steve is equally interested in the role of the mind when it comes to maximizing productivity and happiness.

Happify

(<http://www.happify.com/hd/cultivate-an-attitude-of-gratitude/>)

This post on Happify is all about cultivating a 'gratitude attitude' that will help to make you happier and more content in your life.

Tools and Equipment

There are a number of different tools and pieces of equipment you can use to start taking greater control of your mind. Here are some of the most interesting and useful...

Headspace

(www.headspace.com)

Headspace is an app that also has a companion website and that provides guided meditation sessions. The first ten sessions are ten minutes long each and provide you with a brief 'break' from the business of daily life. As you progress, you'll unlock new and more advanced meditations – though there is a fee once you get further in.

Mindfulness meditation is something we only briefly touched on in the book but it's a highly important tool that you can calm your mind and to reflect on the contents of your thoughts. Mindfulness has been shown in studies to help reduce stress and improve grey matter in the long term.

Brainwave Entrainment

Brainwave entrainment is an interesting concept that involves listening to different pitches in each ear. The theory is that this can manipulate your brainwaves, helping you to sink into a calmer and more relaxed theta state at will. There's not a lot of evidence to support this theory however.

Neurosky Mindwave

Something that does have a good body of evidence behind it is the concept of using commercial EEGs to calm your mind. EEGs are 'electro-encephalographs' and have the ability to record brain-wave activity. This can be paired with meditation or mindfulness training in order to learn to better control the amount of activity between cells. The belief is that you can this way progress much more quickly than you would otherwise be able to.

Foc.us

The Foc.us headset was originally aimed at gamers but has since been co-opted to be used in a range of other scenarios. The idea this time is not to record activity between neurons but rather to stimulate activity. This doesn't mean that the device forces electrical impulses to fire but rather that it makes them more likely to by priming them. This can improve performance in a range of tasks and is also useful for accelerated learning.

The Pomodoro Technique

(<http://pomodorotechnique.com/>)

This is a great example of how you can change your mindset and approach in order to get more done. The Pomodoro Technique involves breaking your activity down into short periods of productivity, with intermittent breaks for recovery.

Bracelets

You can use a bracelet as a smart trick to 'remind yourself' to think a certain way or do a certain thing. Will Bowen (www.willbowen.com) makes bracelets for this specific cause but of course you can use any bracelet or even just a piece of colored string to do the same job!

The Mindset of a Game Changer
